NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 66 contigs. The true order of the pieces is not known and their order in this sequence record is
                                                                                                                                                      arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to methods for predicting toxic effects of compounds or the progression of these toxic effects by determining the global changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in unexposed tissues or cells. Also included are methods of predicting at least one toxic effect of a compound or progression of a toxic effect, preferably the hepatotoxicity of a compound, comprising detecting the level of expression in a tissue or cell sample exposed to the compound of two or more genes listed in the specification, where differential expression of the genes is indicative of at least one toxic effect or progression. The method can also be used to identify an agent which modulates the toxic response and predict cellular pathways that a compound modulates in a cell. The methods utilise a set of at least two probes (on a solid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Predicting toxic effects of compounds or the progression of these toxic effects by determining the changes in gene expression in tissues or cells exposed to the toxin and comparing these to gene expression in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Rat sequence differentially expressed in response to a hepatotoxin #461.
disorders related to peptidergic signalling in which NEPII in involved, e.g. cardiovascular or neurodegenerative diseases; growth disorders of endocrine origin; disturbances of the hypothalamic-hypophyseal axis or endocrine disorders.

support in kit form), where each of the probes comprises a sequence that specifically hybridises to a gene listed in the specification, a computer system comprising a database containing information identifying the expression level in a tissue or cell sample exposed to a hepatotoxin of a set of genes comprising at least two genes listed in the specification, and a user interface to view the information used to present information identifying the expression level in a tissue or cell of at least one gene listed in the specification. The method is useful for elucidating global listed in the specification and for identifying toxicity markers in toxicity markers in drug screening and toxicity assays. The genes and perediction not identification may be used as diagnostic markers for the prediction of the physiological state of tissue or cell procession information of the physiological state of tissue or cell

E. Myers ייבי באטומופס nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -

Claim 1; SEQ ID NO 28483; 21pp + Sequence Listing; English..

is The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072) seduences

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to lung specific genes (LSG) and their corresponding polypeptides. LSG is useful for identifying, diagnosing, monitoring, staging, inaging and treating lung cancer and non-cancerous disease states in lung, identifying lung tissue, monitoring and modifying lung embryonic development and differentiation, in gene therapy, as hybridisation probes, to detect LSG mRNA as a marker for lung cancer, as research reagents and materials for discovery of \text{Vertaupent} treatments and diagnostics to human disease, to detect complementary polynucleotides, and for chromosome identification. An antibody which binds LSG is useful to detect or image localisation of LSG in a patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel lung specific gene useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous disease states in lung, for gene therapy, and for identifying lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             for preventing the

AAK54951 to AAK64702 encode the human immune/haematopoletic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased carpression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the coroten. (I) proteins and polynucleotides may be used to prevent, cancers and cancer metastases of haematopoletic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoletic antigen genomic sequences from the present invention. AAK54912 to AAK64950 and AAAM82169.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis

Bacteriophage.

99US-0294093. 98US-082567P 16-APR-1999; 21-APR-1998;

The present sequence represents a DNA sequence from a novel bacteriophage which has high specificity for pathogenic bacteria, especially for strains of Escherichia coli causing enteric haemorrhage, such as E. coli 0157. The bacteriophage can be incorporated into blo-bactericidal compositions. These can contain more than one bacthogen at the same time. The blo-bactericide may also contain an amino-acid or other material to control the pH to 6.5-7.5 and ensure stability of the bacteriophage, such as glycine, arginine or lysine. The bio-bactericidal composition can be used for treating food (such as meat or fish) to prevent bacterial contamination, e.g. in fresh food or in the kitchens of restaurants, schools and other institutions. It may be formulated as a spray. It can also be used to sterilise working the containers. as Bacteriophage with high specificity for particular pathogens such Escherichia coli 0157 is incorporated in bactericides for food Length 563; Sequence 563 BP; 182 A; 93 C; 114 G; 169 T; 5 other; humans but very potent against pathogenic bacteria. RESULT 8 ABL73130

ABL73130 standard; cDNA; 295 (first entry) 14-MAY-2002 ABL73130;

Corn tassel-derived polynucleotide (cdps) SEQ ID NO:2504.

Corn; corn tassel-derived polynucleotide; cdps; hybrid breeding; CDPs inheritance; characteristic; growth; development; disease resistance; environmental adaptability; quality; yield; molecular marker; multigene trait; plant breeding; corn tassel; gene; ss. JS2001051335-A1 13-DEC-2001 Zea mays. 

```
The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                              New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 351 BP; 96 A; 89 C; 90 G; 76 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence describes a purified corn tassel-derived polynucleotide sequence (cdps) comprising a nucleic acid sequence selected from those given in ABL70627 to ABL70833. The cdps sequences cord tassel-derived polypeptides (CDPs). The cdps sequences con tassel-derived polypeptides (CDPs). The cdps sequences can be used for determining altered gene expression, to recover regulatory elements and to follow inheritance of desirable characteristics through hybrid breeding programs. (I) are also useful in the evaluation, and alteration of desired characteristics associated with growth and development, disease resistance, environmental adaptability, quality and yield, and as molecular markers for studying inheritance of multigene traits in a plant breeding program. (I) can be used to produce a tassel-specific profile of gene transcription, a used to produce a tassel-specific profile, independent of colone regulatory elements for use in transformation vectors, to express a polypeptide, to identify, isolate or extend the profile of colone regulatory elements for use in transformation therein a plant isolate or extend the profile of colone regulatory elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                        The present sequence encodes a human transmembrane proteins (HTWP). Agonists and antagonists of the protein are used to treat a disease or condition associated with overexpression of the protein. Diseases and conditions which can be treated include cell proliferative, immunological, reproductive, smooth muscle and neurological disorders e.g. arteriosclerosis, myeloma tuckemia, acquired immunodeficiency syndrome (AIDS), allergies, ovulatory defects, angina, hypertension, stroke, Alzheimer's disease, epilepsy and fourette's disorder. The bolynucleotides may be used to detect and quantify gene expression in biopsied tissues where protein expression may be correlated with disease e.g. to determine absence, presence or excess expression of HTMP or to monitor regulation of HTMP expression during therapeutic intervention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; cancer; colon; breast; ovary; oesophagus; kidney; thyroid;

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABLG1664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adentical cancer, infiltrating ductal cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Horrigan S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set

The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in capression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises a sequence (S) selected from 8447 sequences (given in ABL61664 cexpression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, coscophageal, ovarian, kidney, prostate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine
                                                                                                                                                                                                                                     Sequence 2226 BP; 412 A; 686 C; 666 G; 462 T; 0 other;
                                                                                                                                                                                                              carcinoma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                               Query Match 73.6%;

                                                                                                                                                                                                                                                                                                                                                                                                                      28-MAR-2002.
                                                                                                                                            ABN79910:
```

chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set

Claim 1; SEQ ID 7201; 44pp; English

Screening for anti-neoplastic agent involves exposing cells to

WPI; 2002-188264/24.

```
may be used for Improving the production of the secondary metabolite e.g antibacterial (such as beta-lactam), an anti-hypercholesterolaemic (such as large as lovastin or mevastatin), an immunosuppressant (such as cyclosporin A), as lovastin or mevastatin), an immunosuppressant (such as cyclosporin A), as ovalicin), a glucan synthase inhibitor, gliotoxin family of compounds, a fungal toxin, a modulator of cell surface receptor signalling, a plant compound. The method results in a decrease in fermentor run-time, a decrease in the size of the fermentor required for the production of equivalent amounts of the secondary metabolite, or a decrease in the blomass required for the production, which translates into decreased in records ABN79764-ABN79911 repersent ZBC genes of the invention.

Note: The sequence data for this patent did not form part of the printed

Rsk-3 can be used to treat or ameliorate cancer. Rsk-3 inhibitors can also be used to treat cancer. Vaccines comprising mutant Rsk-3 or nucleic acids encoding mutant Rsk-3, where the mutant is found in cancer cells, are useful for treatment of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides the protein and coding sequences of 444 movel human proteins. These were isolated from expressed sequences tags (ESTS). They can be used to stimulate cell growth, to regulate e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat untiliple. Scalerosis, to regulate activin or inhibin e.g. to treat infertility, to regulate haemostasis or thrombolysis e.g. to treat stroke and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g.

2 CAAAGCACTAGCTTCAGTGTG 22

This sequence represents a P1 artificial chromosome (PAC), designated 4274, and containing the p90 ribosomal S6 kinase-3 (Rsk-3) gene. The invention relates of diagnosis, prognosis and treatment of cancer related to the Rsk-3 gene. The methods are used for diagnosis, prognosis and treatment of cancer, especially ovarian or breast cancer or lymphoma. Nucleic acids that selectively hybridise to the Rsk-3 gene or cDNA, or a multant Rsk-3 allele, or a molecule that selectively binds to Rsk-3 polypeptide can be used to manufacture reagents for diagnosis of cancer.

Example 1; Fig 16a; 167pp; English.

Patentin Release #1:0, Version #1.30

SOFTWARE:

PATCH, Andrew J

```
Sequence 457, Application US/09071035
Patent No. 648043
GENERAL INFORMATION:
GENERAL INFORMATION: GI1 H. Chol
TITLE OF INVENTION: Enterococcus faecalis Polynucleotides and Polypeptides
NUMBER OF SEQUENCES: 496
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GENERAL INFORMATION:

was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114 gb)RF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to

Sequenced from the Brugia malayi BAC library constructed by Claire
Whitton and Dr Mike Quall. The Sequence was generated by The
Pathogen Sequencing Unit, The Sanger Institute, Cambridge, UK in
collaboration with Mark Blaxter, ICAPB, University of Edinburgh,
Bdinburgh, UK.
Seq primer: T? (TAMTACGACTCACTATAGGG)
Class: BAC ends.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                    NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft" sequence. It currently consists of 56 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
